

# Karachi Heat Priority Map

**DRAFT for Samraj to edit before it is handed to anyone.** Written for: [the organisation that agrees to host the pilot: fill in once one has said yes]

A free map that suggests where heat-relief support should go first in **Landhi Town** during a heatwave, and says why. Support means drinking water, ORS, cooling points and ambulance standby. It is a tool for your team's judgement, not a replacement for it.

## What it is

- Landhi is split into **265 small areas** of about 0.1 km<sup>2</sup>. Each is ranked from how hot the ground gets on summer afternoons (satellite data), how many people live there, and how little shade and access to a clinic it has.
- Tap any area to see **why** it ranks where it does, and **how sure** the model is.
- **Plan supplies:** say where your stock is and how much you have, and it suggests how to split it, highest priority first, within the distance your team can reach.
- **Field briefs:** one printable page per named place, small enough for WhatsApp.
- Works on a phone, and **offline** once it has been opened once.

## What it is not

- **Not an official warning system.** For heatwave warnings, follow the Pakistan Meteorological Department and PDMA Sindh.
- **Not a prediction of deaths**, and never a verdict on any neighbourhood.
- **Not finished.** The weights are placeholders and no relief centre has been checked in person yet. The population data counts about half the people the 2023 census found. It **cannot see power cuts**, which the Edhi Foundation named as a major factor in June 2024.

## How to read the map in two minutes

1. Open the link below. **Darker areas are higher priority** for support *within Landhi*. It is a ranking, not a measurement.
2. **Tap an area.** You see its rank, the reasons in plain words, and its values.
3. **Dashed outlines** are areas the model is unsure about. Your own knowledge matters most there.
4. **Plan supplies** gives a quick estimate of how to split your stock. Treat it as a starting point.

## What would help most

1. **Where is it wrong?** Name places it ranks too high or too low, and why.
2. **Rank a dozen places yourself, before looking at the map**, on the one-page form. This is how we find out whether the map is any use.
3. **Your centre:** where it is, whether it can hold stock, how far you deliver, and how much water per person you plan for.
4. **Power cuts:** which areas are worst. The feeder name printed on an electricity bill would let us add power cuts to the map honestly.
